SFP BIDI 1.25G 1310/1490 nm 20 km DDM

SFP Transceiver Series

- **Up to 1.25 Gb/s data links**
- **DFB laser transmitter**
- **PIN photodetector**
- **Up to 20 km on 9/125 µm SMF**
- **Hot-pluggable SFP footprint**
- **BIDI LC/UPC type pluggable optical interface**
- **Low power dissipation**
- **Metal enclosure for lower EMI**
- **RoHS compliant and lead-free**
- **Supports the Digital Diagnostic Monitoring interface**
- **Compliant with SFF-8472**

ACT's SFP-AG-SP-4931 transceiver is a flexible solution as an interface for switches, routers, servers, and other optical links. This SFP transceiver can carry data links at rates up to 1.25 Gb/s, and is compatible with the SFP Multi-Sourcing Agreement (MSA). The transceiver module covers data link up to 20KM in 9/125um single mode fiber. It is BIDI with the 1310nm FP laser and the 1550nm DFB laser.

The optical output of the transceiver can be disabled by a high-level TTL TX disable input, and the module can also be disabled via I2C. TX fault is provided to indicate any degradation of the laser. A loss of signal (LOS) output is provided to indicate if there is any loss in the receiver input optical signal or if there are any problems with the link status of partner devices. The system can obtain the LOS /link /disable /fault information using an I2C register access.
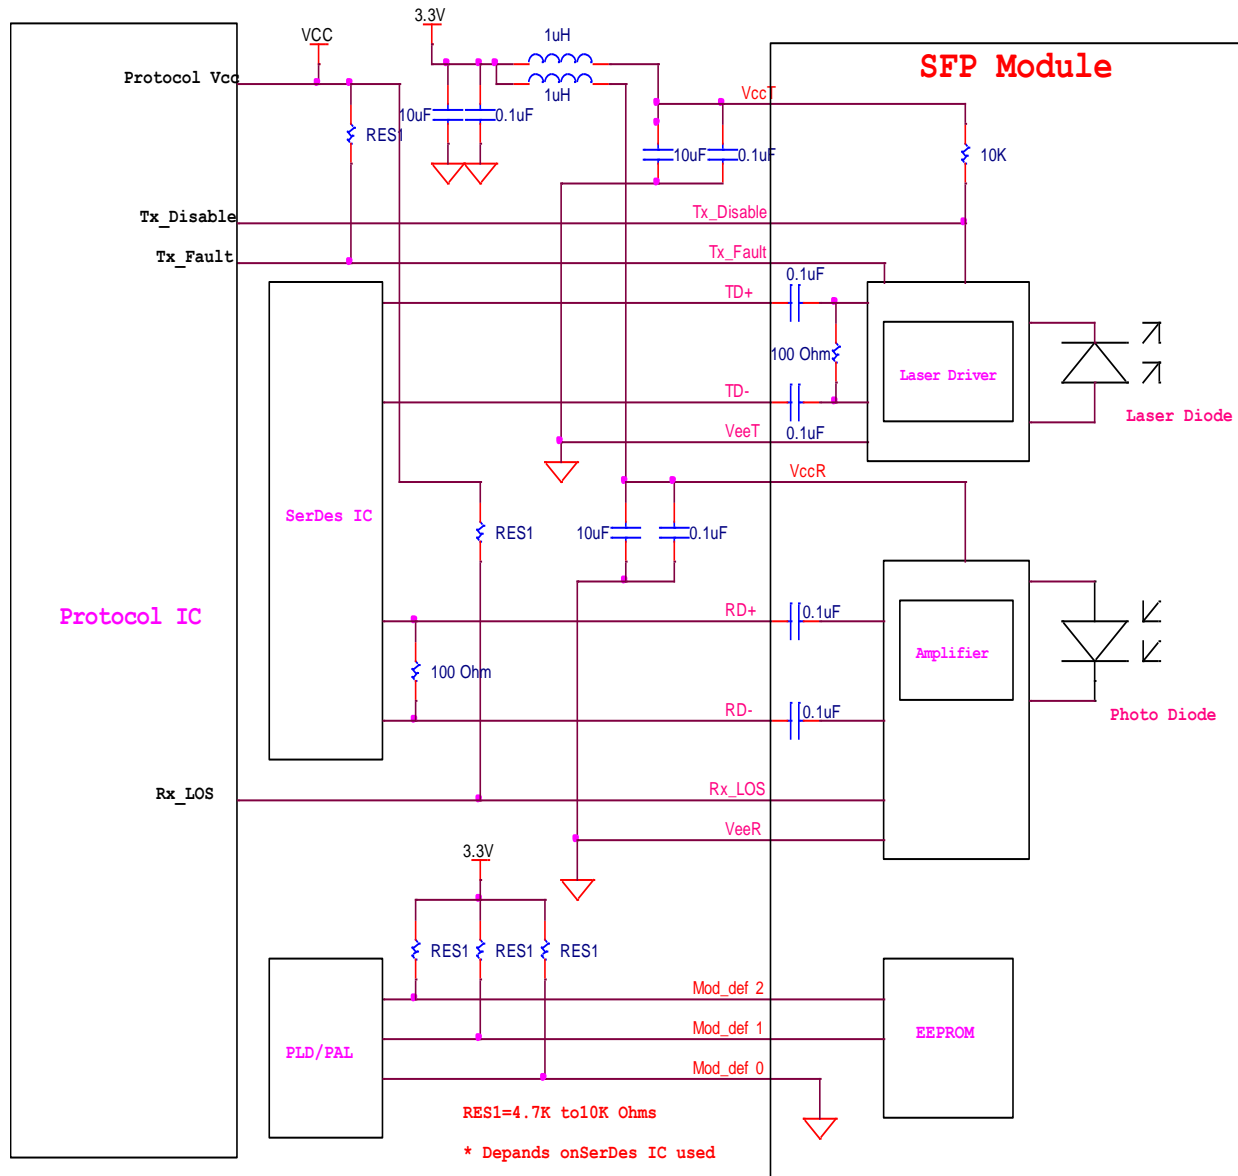

Key Features

- Up to 1.25 Gb/s data links

- DFB laser transmitter

- PIN photodetector

- Up to 20 km on 9/125µm SMF

- Hot-pluggable SFP footprint

- BIDI LC/UPC type pluggable optical interface

- Low power dissipation

- Metal enclosure for lower EMI

- RoHS compliant and lead-free

- Supports the Digital Diagnostic Monitoring interface

- Compliant with SFF-8472

Pin Descriptions

Pin-out of Connector Block on Host Board

Pin	Symbol	Name/Description	Note
1	VEET	Transmitter Ground (Common with Receiver Ground)	1
2	TFAULT	Transmitter Fault. Not supported.	-
3	TDIS	Transmitter Disable. Laser output disabled on high or open.	2
4	MOD_DEF(2)	Module Definition 2. Data line for Serial ID.	3
5	MOD_DEF(1)	Module Definition 1. Clock line for Serial ID.	3
6	MOD_DEF(0)	Module Definition 0. Grounded within the module.	3
7	Rate Select	No connection required.	4
8	LOS	Loss of Signal indicator. Logic 0 indicates normal operation.	5
9	VEER	Receiver Ground (Common with Transmitter Ground)	1
10	VEER	Receiver Ground (Common with Transmitter Ground)	1
11	VEER	Receiver Ground (Common with Transmitter Ground)	1
12	RD-	Receiver Inverted DATA out. AC Coupled.	-
13	RD+	Receiver Non-inverted DATA out. AC Coupled.	-
14	VEER	Receiver Ground (Common with Transmitter Ground).	1
15	VCCR	Receiver Power Supply	-
16	VCCT	Transmitter Power Supply	-
17	VEET	Transmitter Ground (Common with Receiver Ground)	1
18	TD+	Transmitter Non-Inverted DATA in. AC Coupled.	-
19	TD-	Transmitter Inverted DATA in. AC Coupled.	-
20	VEET	Transmitter Ground (Common with Receiver Ground)	1

Notes:

1. Circuit ground is internally isolated from chassis ground.

2. Laser output disabled on T_{DIS} >2.0V or open, enabled on T_{DIS} <0.8V.

3. Module definition pins should be pulled up with 4.7 ~ 10 kΩ resistors on the host board to a voltage between

2.0V and 3.6V. MOD_DEF(0) pulls the line low to indicate that the module is plugged in.

4. This is an optional input used to control the receiver bandwidth for compatibility with multiple data rates (most likely Fiber Channel 1x and 2x rates). If implemented, the input will be internally pulled down with a > 30kΩ resistor. The input states are:

Low (0 – 0.8V):   Reduced Bandwidth
(>0.8V, < 2.0V):   Undefined
High (2.0 – 3.465V):   Full Bandwidth
Open: Reduced Bandwidth

5. The LOS pin is for open collector output. It should be pulled up with a 4.7 ~ 10 kΩ resistor on the host board to a voltage between 2.0V and 3.6V. Logic 0 indicates normal operation; logic 1 indicates loss of signal.

Digital Diagnostic Functions

ACT SFP transceivers support the 2-wire serial communication protocol as defined in the SFP MSA. It is very closely related to the E2PROM defined in the GBIC standard, with the same electrical specifications.

The standard SFP serial ID provides access to identification information that describes the transceiver's capabilities, standard interfaces, manufacturer, and other information.

Additionally, ACT SFP transceivers provide a unique enhanced digital diagnostic monitoring interface, which allows real-time access to device operating parameters such as transceiver temperature, laser bias current, transmitted optical power, received optical power, and transceiver supply voltage. It also defines a sophisticated system of alarm and warning flags, which alerts end users when particular operating parameters are outside of a factory set normal range.

 The SFP MSA defines a 256-byte memory map in E2PROM that is accessible over a 2-wire serial interface at the 8 bit address 1010000X (A0h). The digital diagnostic monitoring interface makes use of the 8 bit address 1010001X (A2h), so the originally defined serial ID memory map remains unchanged. The interface is identical to and thus fully backward compatible with both GBIC specifications and the SFP MSA.

The operating and diagnostics information is monitored and reported by a Digital Diagnostics Transceiver Controller (DDTC) inside the transceiver, which is accessed through a 2-wire serial interface. When the serial protocol is activated, the serial clock signal (SCL, Mod Def 1) is generated by the host. The positive edge clocks data into segments of the E2PROM that are not write-protected within the SFP transceiver. The negative edge clocks data from the SFP transceiver. The serial data signal (SDA, Mod Def 2) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially.

Digital diagnostics for the ACT SFP transceivers are internally calibrated by default.
